*****This will be the second time we are promoting trading the TF and the ZB for the NFP report as an alternative to the CL. I recommend picking 1 of the 3 indexes and trading ONLY 1. The ZB has proven to be the best performer lately, giving a safe entry with minimal slippage, low margin, high value per tick, a bit more stable, and remains at the peak of the spike longer making it easier to capture and achieve more profit. Keep in mind 1 tick on the ZB is \$31.25.**

Most of the reports in the last several months have been mixed bags. Usually a moderate 70-125K increase with variable changes in the rate. Any drop in the rate has been due to less people in the labor force, not sizable gains in hiring. This makes traders suspect of any positive news. The ADP report on Thursday showed a greater than expected 215K jobs were created. While there is little correlation between the BOLS report and the ADP report, this is possibly a bullish indicator. Remember the # of jobs created carries more weight here than the U-3 % of unemployed, but if the rate change is divergent to the job #s, it can cause initial indecision. **The investors are also suspect**

of the Bureau of Labor Statistics (BLS) cooking the books as the drop in the rate has been tied to people leaving the labor force and the election. With the dramatic decrease to 7.8% in October without the job creation to support, we could still see some correcting. It is easier to fudge the rate than the # of jobs.
